This enhancer element is derived from the flanking region of the human epithelial cell secretory leukoprotease-inhibitor gene. (Updated on 25-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inter-Alu PCR was performed on YACs 905C2 and 763B11. Unpurified YAC DNA was amplified with generate primers Alu 5' (AAT63214) and Alu 3' (AAT63215). Genetic linkage strategies have placed a gene causing early onset Alzheimer's disease (AD) on the long arm of chromosome 14 between D14S289 and D14S61. The gene, S182 (see also AAT63207), was localised to a 100 kb region between D14S77 and D14S668E (see also AAT63216-22). A number of novel mutations in the S182 gene have been identified in
Detection of single nucleotide polymorphisms in genomes by preparation

The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to
A novel method for simultaneously determining the level of a number of target polynucleotides in a sample has been disclosed. The method involves forming double stranded copies of the target sequence in direct proportion to the target levels in the original sample. The target sequence is copied using primer pairs designed to flank a defined region in the target sequence. The double stranded copies are then cleaved and reacted with either first or second adaptor sequences. The first and
                                                                                                                                                                               Measuring target polynucleotide sequences in biological samples by contacting sequence-selective primer pairs, forming conjugates with adaptor molecules, polymerizing target-identifier dimers and quanti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                P2; CX5C chemokine; Chromosome 5q31; gene therapy; asthma; PCR primer; allegic rhinitis; urticaria; anaphylactic shock; hives; hay fever; human;

The adaptor sequences are then polymerised to conjugate mixtures are then allowed to form dimers with each other through the target sequences. These dimers are then polymerised to form cd dimer multimers. The relative abundances of target identifiers in the continuous polymucleotide abundance level profiles for cells and contisues under various conditions, stages of development and and disease consistency particularly where the target polymucleotide is present at low levels. The method may also be used in the discovery and evaluation of condition to the method described above, the invention also includes the colymucleotide and polypeptide of P2. P2 is thought to be a member of a convel chemokine family, denoted CXSC and may be associated with immune convel chemokine family, denoted CXSC and may be associated with immune convel chemokine family, denoted CXSC and may be associated with in the convel chemokine family, denoted CXSC and may be useful in the convel chemokine family, denoted CXSC and may be associated with immune convel chemokine family, denoted CXSC and may be useful in the convel chemokine family, denoted CXSC and may be useful in the convel chemokine family, denoted CXSC and may be useful in the convel chemokine family, denoted CXSC and may be useful in the converse of the pay. The pay polymucleotide may be useful in the converse of the pay. The pay polymucleotide to chromosome 5, within the cytokine gene cluster at 5331. The present sequence is the forward primer pay for target sequence human P2 gene has been localised to chromosome 5, within the cytokine gene cluster at 5331. The present sequence is the forward primer pay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

This sequence represents cDNA encoding cysteine protease 10. The protein control of 10 kp, and has homology with a cysteine protease given in AAB73746 over a 51 amino acid stretch. The invention crelates to cysteine protease 10 (AAB73746), nucleic acids encoding it (AAH46153), and a method for the recombinant production of cysteine protease 10. The present invention additionally discloses an agonist of cysteine protease 10 for therapeutic use, and an antibody which specifically binds to cysteine protease 10. Cysteine protease 10, and conclectides which encode it may be used for treating a variety of conditions. The protein may also be used to screen for modulators of its conditions. The protein may also be used to screen for modulators of its cativity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reactions or as a probe for hybridisation reactions, or in producing gene chips or conditions. Sequences AAH46154-AAH46155 represent reverse transcription-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                The invention relates to the human Pax protein 9 with cytostatic, virucide, immunomodulatory, antiinflammatory, haemostatic and anti-HIV activity. The polypeptide and encoded polynucleotide, with paired box domain, are applicable in diagnosis and treatment of malignant neoplasm, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases, various inflammations, developmental disorders, growth developmental disturbance and Waardenburger's syndrome. The polynucleotide is useful for gene therapy. The present sequence is that of a human Pax protein 9 PCR primer, useful to the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABCl expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal

The polypeptide and the polymucleotide encoding it are useful in the diagnosis and treatment of malignant neoplasms, haemopathy, HIV infection, immunological diseases and various inflammatory diseases. The present sequence is a primer used to isolate a polynucleotide encoding the polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fumarase 9 polynucleotide and polypeptide, useful in diagnosis and treatment of malignant neoplasm, hemopathy, HIV infection, immunoldiseases and various inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Unidentified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a new method for determining whether a subject has or is predisposed to developing a disease or condition that is associated with an IL (interleukin)-1 inflammatory haplotype, comprises detecting at least one allele of the haplotype, where the presence of the allele indicates that the subject is predisposed to the development or has the disease or condition. The method is useful for determining whether a subject has or is predisposed to inflammatory disease, a degenerative disease, an immunological disorder, an infectious disease, trauma induced disease, or cancer. The above conditions associated with an IL-1 inflammatory haplotype can be treated or prevented by administering a therapeutic that compensates for a causative mutation that is in linkage disequilibrium with at least one II-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0
```

primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by

Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes inspindus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune alseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNB containing NNA sequence.
New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc

performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic raits also include symptoms of or suscensivibility to multifearchis!
                                                                                                                                       traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific

RR, Nandabalan **7** Sanchis Þ Stephens Ĺ,

New nucleic acid containing polymorphisms for gene therapy of inflammation and for ε s in the cyclooxygenase-2 gene, establishing a genotype or

Example 1b; Page 39; 118pp; English.

AAF80897 represent human PTGS2 gene and coding sequence, and the proprotein is represented by AAB72199. The invention includes PCR and sequencing primers, and probes represented in AAF80898 - AAF81151 v are used to isolated and characterise the PTGS2 gene sequence, and This invention relates to a polynucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence AAF800896 contains 27 single nucleotide polymorphisms (SNPs). AAF80896 and AAF81151 which

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a

flanking sequence,

PTGS2 proteins and polynucleotide sequences are used to express variant PTGS2 proteins, for structural analysis or drug-binding studies and also in gene therapy (either expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for diagnosis, prognosis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 haplotype and genotype, especially for determining association between a particular trait, e.g. a clinical response to drugs that target PTGS2 but also disease susceptibility, severity or stage. Anti-PTGS2 antibodies are particularly used for developing diagnostic tests and treatments for immune-related disorders such as archritis and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2. Transgenic animals that express PTGS2 are used to study expression of PTGS2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; line 1-12; cytostatic; virucidal; immunomodulatory; antiinflammatory; haemostatic; malignant tumour; HIV; infection; human immunodeficiency virus; immunological disease; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    effects of therapeutic agents
                               The invention relates to human line 1-12 with cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence is that of a human line 1-12 PCR primer, useful to the invention
                                                                                                                                                                                            Line 1-12 and encoded polynucleotide, used in diagnosis and treatment malignant tumors, hemopathy, human immunodeficiency virus infection,

Also described a method for producing (I) using DNA recombination technology. (I) car used in the treatment of several diseases, such as vegetative nervous dysfunction, psychic disease, endocrinopathy, growth development disturbance disease and tumours. The present sequence represents a PCF disturbance disease and tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; mPer3-10.01; vegetative nervous dysfunction; psychic disease; endocrinopathy; growth development disturbance disease; tumour; PCR primer; ss.

The protein has a molecular weight of 9.35 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Sailor transposase 9.35 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus) infection. Sequences ABV76754 ABV76755 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human sailor transposase 9.35 cDNA

                                                                                                 The invention relates to the novel human alpha 2,3-sialyltransferase 9.90, and the polymucleotide encoding it. The polymeptide is useful for treating various diseases, such as an immunological defect, various tumours and various inflammations. The invention also discloses the antagonist resisting the polymeptide and its treatment effect. The present sequence represents a PCR primer used to amplify the the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes human transcription regulatory factor 16.06 (I). Also described is a DNA recombination process used to produce (I). (I) can be used for treating various diseases, such as embryonic development malformation, tumours and protein metabolic disorder disease. The present sequence represents a PCR primer for (I), which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide-human transcription regulatory factor 16.06 and polynucleotide for encoding the polypeptide, embryonic development malformation, tumors, and protein metabolic disorder disease.
                                                       Sequence

The sequences can be used in the treatment of cancers, coughs, cardiac asthma, diarrhoea, constipation, colic, psychic disease and morphinic analgesic acute poisoning. The present sequence is a PCR primer used to isolate the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CN1345751-A.

The present invention also discloses applying the polypeptide in treating various diseases, such as malignant tumours, inflammations, immunological diseases, haemopathy and human immunodeficiency virus (HIV) infection. The present invention also discloses the antagonist resisting the polypeptide and its treatment effect. The present invention also discloses the application of the polymucleotides for encoding guanosine triphosphatase activator protein 10.12. The present sequence is a reverse transcriptase (RT)-PCR primer used to isolate nucleic acids encoding guanosine triphosphatase activator protein 10.12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ชัร-JUN-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 2; Page 17 (disclosure); 33pp; Chinese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptide-quanosine triphosphatase activator protein 10.12 and polynucleotide for encoding such polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2002-714410/78.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to Ras GTP enzyme-activating protein 20.68 (ABPSB53) and nucleic acids encoding it (ABPN6760). The protein has a molecular weight of 20.68 kD and is also referred to as cancer suppressor protein-20.68. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Ras GTP enzyme-activating protein 20.68 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus) infection. Sequences ABV76761-ABV76762 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate Ras GTP enzyme-activating protein 20.68 cDNA
Sequence
                         peptide receptor 11.66 PCR
                                     The invention relates to human natriuretic peptide receptor 11.66. The polypeptide is useful for treating various diseases, such as malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is that of a human natriuretic
                                                                                                                                                        New polypeptide-human natriuretic peptide 11.66 and polynucleotide encoding the polypeptide, useful for treating malignant tumors, hemopathy, HIV infection, immunological diseases and various

                                                                                                                        The invention relates to an isolated polypeptide of phytochrome 12, the cDNA encoding it, and its fragment, analogue or derivative. Also included are vectors expressing protein, a host cell comprising the vector, the isolation of modulators of the protein and an anti-phytochrome 12 antibody. The protein and nucleic acid are used in diagnosis and treatment of a malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence is an RT-PCR (reverse transcriptase PCR) primer used to isolate the cDNA encoding the phytochrome 12
                                                                                                                                                                                                                                                                                 phytochrome 12 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation.
                                                                                                                                                                                                                                                                                                                                                               Mao

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human phosphatidic acid phosphatase 2-12 (AAM49149) and to nucleic acids encoding it (ABI99960). The protein has a molecular weight of 12 kD. The inevntion also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Phosphatidic acid phosphatase 2-12 can be used in the treatment of a variety of diseases such as cancer and HIV (human immunodeficiency virus) infection. Sequences ABI99961-ABI99962 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human phosphatidic acid phosphatase 2-12 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide-human phosphatidic acid phosphotase 2-12 diseases such as cancer and human immunodeficiency virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           31-MAY-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human cytokine receptor 15 (see AAB47984). Human cytokine receptor 15, and the DNA encoding it, are in diagnosis and treatment of mallignant tumour, hemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. This sequence is a PCR primer which was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytokine receptor 15 and encoded polynucleotide, applicable in and treatment of developmental disorders, cancer, hemopathy, HI infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2002-026253/03

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 3; Page 12; 38pp; Chinese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-APR-2000; 2000CN-00115491.
                    The invention comprises the amino acid and coding sequence of toncogene protein 11.66. The oncogene protein 11.66 DNA and protogenences are useful for treating malignant tumour, haemopathy, development disturbance, HIV infection, immunological disease a development disturbance.
                                                                                                                                                                                                                                                                         30-JAN-2002.
                                                                                                                                                                                                                                                                                                                                                                                                Human oncogene protein 11-66 PCR primer 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAL43822;

                                                                                                                                                                                                                  Sequence 24
                                                                                                                                                                                                                                    The invention relates to the human SOX3 protein 13.31 and the polynucleotide encoding it. The polypeptide is used in treating various diseases, such as malignant tumours, heamopathy, HIV infection, immunological diseases and various inflammations. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in isolation of cDNA encoding the human SOX3 protein 13.31

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel polypeptide-hexokinase protein. The protein can be expressed by standard recombinant methodology. The novel polypeptide and encoding polypucleotides are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents the polypeptide-hexokinase protein cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mao

New polypeptide-amylase 9.35 human immunodeficiency virus

for treating malignant tumor, hemopathy, infection, immunological disease and var

and various

inflammations.

Example 2; Page 15

(disclosure); 31pp;

Chinese

coding for the polypeptide and method for producing this polypeptide by using DNA recombination technology. The invention also discloses the method for curing several diseases, such as malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations by using the polypeptide. The invention also discloses an antagonist for resisting said polypeptide and its therapeutic action and also discloses the application of the polymucleotide for coding this novel amylase 9.35. The sequence presented is the reverse transcription (RT)-PCR primer, #2, which was used to isolate amylase 9.35 cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               05-DEC-2002
The present sequence is a probe, created by PCR, for human 14273 (see ABQ81226), a nucleic acid associated with metabolic disorders. The probe was used to examine the expression profile of human 14273 in different tissues. It was found that 14273 molecules are expressed at high levels.
                                                                                                                                                                                                                                                                                               Identifying a nucleic acid associated with a metabolic disorder, useful for diagnosing metabolic disorders, e.g. obesity, comprises contacting the sample with a probe comprising at least 25 contiguous nucleotides of the 14273 gene.
                                                                                                                                                                                                                 Example 1; Page

of.

syndrome associated protein 11.11, and the polynucleotide encoding it. Also described is a process for preparing the polypeptide by DNA recombination and the application of the polypeptide and polynucleotide in treating various diseases such as cancer and human immunodeficiency virus (HIV) infection. Antagonist against the polypeptide can also be used in treating such diseases. The present sequence for reverse transcriptase (RT)-PCR primer #1 is used with RT-PCR primer #2 (ABK50652 for isolating cDNA encoding human Parkinson's syndrome associated proteins.

(ABK50652)

The present invention relates to the isolation of human

Parkinson's

They are upregulated during exposure to cold (i.e. under conditions that affect brown or white adipocyte metabolism) and downregulated in genetic models of obesity. The present invention provides 14273 nucleic acids, polypeptides and antibodies useful for the diagnosts and treatment of metabolic disorders including obesity, anorexia, cachexia and diabetes. Also provided are methods for identifying a subject having a metabolic disorder, for identifying a compound capable of modulating metabolic activity, methods for modulating metabolic activity or adipocyte activity (hyperplastic growth, hypertrophic growth or lipogenesis), methods for modulating endogenous glucose or lipolysis in a subject, and a method for regulating endogenous glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, Parkinson's syndrome associated protein 11.11; cancer; human immunodeficiency virus; HIV infection; reverse transcri

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human protein phosphatase 13.64 (ABB83687) and nucleic acids encoding it (ABQ77822). The protein has a molecular weight of 13.64 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Protein phosphatase 13.64 can be used in the treatment of a variety of diseases such as disorders of female genital development, abnormal female sex characteristics, tumours of the female genital tract and oestrogen-related metabolic abnormalities. Sequences ABQ77823-ABQ77824 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human protein phosphatase 13.64 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human protein phosphatase 13.64 polypeptide for treating female genital organ maldevelopment, female sex characteristics abnormality, female genital system tumor and estrogenic relative metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; protein phosphatase 13.64; recombinant production; gene therapy; female genital development disorder; abnormal female sex characteristic; female genital tract tumour; oestrogen-related metabolic abnormality; cytostatic; gynaecological; reverse transcription-PCR; RT-PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   susceptibility to glaucoma or to a progressive ocular hypertensive disorder resulting in loss of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing amplification reaction primers that direct amplification of a selected nucleic acid region containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising obtaining a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or putative regulatory region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, determining DNA, determining the presence or increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid (N1) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineur promoter appearing as ADE13890. Also included are the optineurin promot operably linked to a heterologous nucleic acid, a nucleic acid capable detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a promoter, a host cell comprising the promoter operably linked to a promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         06-MAR-2002; 2002US-00091281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention has developed a novel mechod the discrete invention has developed a novel mechod throlves assaying increased risk for breast or ovarian cancer. The method involves assaying a sample containing human progesterone receptor protein (hpr) with an antibody that distinguishes wild-type hpr from a mutant hPr having a Valco-Leu substitution at amino acid 660, where the presence of such a mutant indicates an increased risk for breast or ovarian cancer. Detection of the G-to-T point mutation gives an odds ratio for ovarian cancer of 3.1 (sensitivity 46%, specificity 78%) and an odds ratio for breast cancer of 2.0 (sensitivity 36%, specificity 78%).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 657
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAH3842
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Increased risk of breast or ovarian cancer can be diagnosed by detecting CC a G to T point mutation at the 1st nucleotide of codon 660 in exon 4 of CC the human progesterome receptor (PR) gene, i.e. nucleotide 2153 of CC AAT84747. The odds ratio is 3.1 (sensitivity 46%, specificity 78%) for CC ovarian cancer, and 2.0 (sensitivity 36%, specificity 78%) for breast CC cancer. The method may also include detecting a C to T point mutation at Ct the 3rd nucleotide of codon 770 in exon 5 of the human PR gene, i.e. CC nucleotide 2485 of AAT84747, and/or an Alu insertion in codon 897 of CC intron G, i.e. AAT84749 inserted between nucleotides 120 and 121 of CC CC concert and with BsrI, and detecting the loss of a BsrI restriction CC site. The mutation in exon 5 can be detected by digesting a test nucleic acid with NIaIII and detecting the loss of a NIaIII restriction site. The mutation in intron G can be detected by digesting a test nucleic acid with NIAIII and detecting the addition of a NIaIII restriction site. The mutation in intron G can be detected by digesting a test nucleic acid with TaqI and detecting the addition of a NIaIII restriction site. The mutation in intron G can be detected by digesting a test nucleic acid with TaqI and detecting the Addition of a NIaIII restriction site. The mutation in intron G can be detected by digesting a test nucleic acid with TaqI and detecting the primers because of the primers are probable of the primers of the primers are probable of the primers of the primers are probable of the pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC or planking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid sample by casses by association analysis the genotype of an individual or group of casses by association analysis the genotype of an individual or group of casses by association analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cc dystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cc disease of which a component is or may be genetic such as autoimmune control of the present sequence and infection by pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic control of the present sequence represents a PCR primer specific for a bursan SNP control of the present sequence represents a PCR primer specific for a bursan SNP control of the present sequence represents a PCR primer specific for a bursan SNP control of the present sequence represents a PCR primer specific for a bursan SNP control of the present sequence control of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 659
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or clemitty of a SNP and for genotyping mucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. Cagammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial consesses of which a component is or may be genetic such as autoimmune contains and acute intermittis, multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPB) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPB. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human can can accept the present sequence represents a PCR primer specific for a human can can be set that the present sequence represents a PCR primer specific for a human can can be set that the present sequence represents a PCR primer specific for a human can can be set that the present sequence represents a PCR primer specific for a human can can be set that the present sequence represents a PCR primer specific for a human can be set to be set to be sequenced as the present sequence represents a PCR primer specific for a human can be set to be set to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ঠ
The present invention describes a method of arraying genome clones. The compliance (a) clones of the genomic libraries contained in clones in the genomic libraries contained in clones multiwell plates; (b) a primer designed based on the chromosome marker contained is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell confidence is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell confidence; (e) the clones in the multiwell plates of the specified confidence; (e) the clones in the multiwell plates of the specified confidence; (e) the clones in the multiwell plates of the specified confidence; (f) the mixed clones are an array the multiwell confidence; (e) the mixed clones are cultured and the confidence of the specified confidence of the specified plates; (f) the mixed clones are cultured and the confidence of the specified plates are specified from the amplified products; (h) the clones in the multiwell confidence of the specified specified products; (h) the clones in the multiwell confidence are specified from the detected result; and (i) the clones are mixed respected result; and (i) the clones are propertied for multiwell confidence and spain and shadassate of the specified confidence and spain and shadassate of the specified confidence are constituted as the positions on the chromosome and arrayed. The confidence are specified for multiwell confidence are specified to the specified confidence are specified to the specified confidence are specified to the specified specified confidence are specified to the specified specified confidence are specified to the specified specified specified specified specified specified specified specified specified specified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 660
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for detecting a gene polymorphism in a human interleukin (II)-18 gene. The method involves detecting a 9 base insertion between -6311 position and -6310 position, a polymorphism at positions -5990, -5316, -4762, -4675, -3268, -689 and -640 of a polymucleotide which consists of a fully defined sequence of 6640 base pairs as given in the specification, where in the 6640bp polynucleotide, the position 6575 is set to +1 from which numbering is performed. The method is useful for detecting gene polymorphism in II-18 gene of human and for detecting adult onset still disease. This polynucleotide sequence represents a probe of the human interleukin-18 gene of the invention.

The method for identifying a subject at CC risk of breast cancer. The method comprising detecting the presence or CC absence of one or more polymorphic variations associated with breast CC cancer in a nucleic acid sample from a subject. The nucleic acid sample CC cancer in a nucleic acid sample from a subject. The nucleic acid sample CC cancer in a nucleic acid sample (ADO79402), KIAA0783 region (ADO79403), DPF3 CC large homolog 1 (Drosophila)) is also known as synapse-associated protein CC 97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The CC gene KIAA0783 is also known as synapse-associated protein is a CC gene kiaA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783 CC has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a CC it likely to be a transcription factor. The gene DPF3 (D4, zinc and CC double PHD fingers, family 3) is also known as CERP4, cer-44, FL414079 CC and 2810403B03Rik. DPF3 is a Rho family guanine-nucleotide exchange CC gene CENPC1 (centromere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere protein C1) is also known as Centromere CC (instrumere and a timely transition to anaphase. The method is CC (instrumere protein C1) is also known as Centromere considered to a breast cancer treatment, and in clinical drug trials. The present ion and treatment of breast cancer, to analyze and cCC trials. The present in an exam

                                                                                                                                                                                                                                                                                                                                                                                                                          the treatment of autoimmune diseases such as glomerulonephritis, disease and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85587 to AAV85822 represent exon primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is succeptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Todd JA, Hear Twe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85823 to AAV85900 represent SNP primers used for obtaining LRP5 CDMA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an IDDM). Individual is susceptible to insulin dependent diabetes mellitus (IDDM). Individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (WELL )
                                                                                                                                                                                                                                                                                                                     Human mdm2 gene; proliferation; tumour; phosphorothicate; p53; cancer; antisense; modulation; oligonucleotide; expression; inhibition; hyperproliferation; blood cancer; brain cancer; breast cancer; lung cancer; soft tissue cancer; psoriasis; fibrosis; atherosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human mdm2 phosphorothioate oligodeoxynucleotide #243.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ37713 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides. AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                            07-JAN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ37720 standard; DNA; 20

AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound 8-30 nucleobases in leacid molecule encoding human mdm-2 useful for mof human mdm-2 and reducing hyperproliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human mdm2 phosphorothioate oligonucleotide
                                                                                                                                                                                 The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              02-MAY-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAF80874 standard;
                                                                                                                                                                                                                                                                                                                                                                                      Example

                                                                                                                          The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleoic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro.
                                                                                                                                                                                                                                 Novel antisense, compound 8-30 nucleobases in length targeted to a nucleoacid molecule encoding human mdm-2 useful for modulating the expression of human mdm-2 and reducing hyperproliferation of human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAF80867 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is related to the coding sequence and protein fragments of a human catenin-binding zinc finger protein. The coding sequence was isolated from a human kidney cDNA library, but is expressed in most human tissue. The sequences provided by the invention can be used in the diagnosis and treatment of cancer and neurological disorders, and in drug screening to identify compounds capable of the same
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Van

The invention also provides an isolated and/or recombinant nucleic acid or its functional fragment, homologue or derivative, corresponding to a alpha-catenin binding protein. The invention also relates to a novel human zinc finger protein binding with a member of the a-catulin/vinculin family, preferably with a human isoform of alpha N-catenin (neural form). The invention also relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                Human; mdm2; hyperproliferative disorder; cancer; psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and poriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdmz expression in various cell functions and physiological processes and useful in both clinical research and diagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; mdm2; hyperproliferative disorder; cancer; psoriasis; atherosclerosis; tumour; cytostatic; anti psoriatic; anti arteriosclerotic; vasotropic; antisense; phosphorothioa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 10 C; 4 G; 3 T; 0 U; 0 Other;

An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon of a nucleic acid encoding human mdm2. region)

Page 18; 81pp; English.

cc site of a nucleic acid encoding human mdm2, where the antisense compound cc modulates the expression of human mdm2. The antisense of incompound condulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having care disease or condition associated with amplification animal having coverexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, atherosclerosis or restenosis, tumours, colorectal carcinoma cardinomic myelogenous leukemia. The antisense compound may be cadministered with a chemotherapeutic agent to overcome drug resistance. The antisense compound, is also useful comethod, which involves the use of the antisense compound, is also useful conditions and compound the role of mdm2 expression in various cell functions and conditions are conditions and conditions and conditions are conditions. AAS29242-AAS29507 represent the human mdm2 antisense conditions are conditions. The present invention relates to antisense compounds, length targeted to the 5' untranslated region, translated codon region, 3' untranslated region, coding region or site of a nucleic acid encoding human mdm2, where the oligonucleotides of the present invention translation termination or translation start 8-30 nucleobases
